FOREWORD

Wetland habitats are threatened by a variety of anthropogenic activities. One such critically threatened habitat is the Keibul Lamjao National Park in Manipur. The habitat supports a unique vegetation association 'phumdis' that are the only home for an equally critically endangered Sangai. An additional cause of concern is the limited genetic diversity retained by the population due to its small size. Despite intensive conservation efforts the population continues to remain prone to extinction due to any chance events.

Therefore, maintenance of viable *ex-situ* populations for ensuring their long-term persistence remains imperative. Effective *ex-situ* conservation of the species can be ensured by scientific management to ensure its long-term survival. This would require management interventions that ensure the maintenance of a genetically viable and demographically stable *ex-situ* population. Pedigree information contained in studbooks forms the basis for this management.

The Central Zoo Authority (CZA) in collaboration with zoos in India has initiated a conservation-breeding program for threatened species in Indian zoos. Sangai is a part of the identified species under this initiative. As a part of this endeavour a Memorandum of Understanding has been signed with the Wildlife Institute of India for compilation and update of studbooks of identified species in Indian zoos. As part of the project outcomes, the WII has compiled the National Studbook of Sangai (*Rucervus eldii eldii*) in Indian Zoos. The recommendations contained in the studbook would form the basis for the long-term management of the species in captivity.

It is hoped that all holding institutions will adopt the recommendations and keep the WII informed of changes in their populations on a regular basis to enable the timely update of the studbook.

(Dr. D.N. Singh, I.F.S.)
Member Secretary
Central Zoo Authority

ACKNOWLEDGEMENTS

The studbook of Sangai (*Rucervus eldii eldii*) is a part of the assignment to the Wildlife Institute of India, Dehradun by the Central Zoo Authority, New Delhi on the development and maintenance of studbooks of selected endangered species in Indian zoos.

The authors are thankful to the Central Zoo Authority for the financial support in carrying out the assignment. The guidance and support extended by Dr. D.N. Singh, IFS, Member Secretary, CZA is gratefully acknowledged. The authors also thank Dr. Brij Kishore Gupta, Evaluation and Monitoring Officer, Dr Devender Singh, Scientific Officer and the support staff of the Central Zoo Authority for facilitating this work.

The valuable advice and support provided by Dr. V.B. Mathur, Director, WII and Dr. G.S. Rawat, Dean Faculty of Wildlife Sciences, is duly acknowledged.

Authors sincerely acknowledge the support from the Directors, Veterinarians and other personnel from holding zoos (provided below) for providing pedigree information that led to the successful development of the studbook.

We also thank Mr. Mukesh Arora for layout and design of this document.

Sangai – *Rucervus eldi*

Taxonomy

Kingdom: Animalia
Phylum: Chordata
Class: Mammalia
Order: Cetartiodactyla
Family: Cervidae
Genus: *Rucervus*
Species: *eldii*
Sub-species: *eldii*

The species was first described in 1839 from Manipur in India as *Cervus frontalis*, and a detailed description of the species was provided by Captain Percy Eld leading to the name *Cervus eldii* (McClelland 1841). The species was split into three sub-species based on descriptions from three separate populations. The population from Manipur was named as *Cervus eldii eldii*; *Cervus eldii thamin* for the Burmese population and *Cervus eldii siamensis* from Thailand (Gee 1961, Aunget al. 2001, Balakrishnan et al. 2003). A fourth population, found in Hainan Island off southern China, was named as *Cervus eldii hainanus* (Xu et al. 1983). The taxonomy of the species has undergone several revisions and the currently accepted classification of the species places it in the genus *Rucervus* with the species and sub-species names remaining unaltered (Grubb 2005). The name was adopted by the IUCN Species Survival Commission (Timmins & Duckworth 2008) and the same is used here.

Recent studies by Angom et al. 2015 and 2017 indicate a closer relationship of the species with sambar (*Rusa unicolor*) and hog deer (*Axis porcinus*). They further reported that phylogenetically the sub-species are monophyletic with *R. e. eldii* being closest to *R. e. thamin*. Their studies also showed the presence of limited genetic diversity in both the wild and captive populations of *R. e. eldii* indicating inbreeding depression in the population. The taxonomic position of the species and its relationship with other deer species remains debatable and is yet to be conclusively established.

Animal Biology

The division of hooves and elongated pasterns (Gee 1961) are adaptations for their unique *phumdi* habitat. The species is a medium sized deer with a head to body length of adult stags may range upto 170 cm, with a shoulder height of upto 130 cm and body weight upto 150 kg. Females are smaller and weigh less than the males. Both sexes have a short

Table 1: Life history traits of Sangai*

Life span	20 years
Inter-birth Interval	1 year
Weight at birth	4.7 – 6 kg
Mating System	Polygynous

* Various sources

tail. Deciduous antlers present in males emerge from the brow leading to its common name – brow antlered deer. The body of the animals is covered with coarse hair with colour varying seasonally. During winters – the breeding season coat colour in males is dark brown while in summers it is reddish brown (Geist 1998).

Habitat Ecology

The subspecies is restricted to a small area of the Keibul Lamjao National Park in Manipur inhabiting wetland areas characterized by floating mats of soil and vegetation (*Phumdis*), patches with floating rooted vegetation, open water areas, small hillocks and shallow water areas (Sanjit et al. 2005). The animals spend considerable part of their time on the *phumdis*; however, drier areas that include tall reeds and grasses and hillocks are preferred for resting (Singh 1991 in Hussain et al., 2004, Angom 2012). The animals rest under tall reeds and grasses during most part of the day.

Vegetation forming the *phumdis* was reported to include 185 plant species of 50 families and 121 genera. The dominant species included *Zizania latifolia*, *Hedychium coronarium*, *Impatiens sp.*, *Cyperus difformis*, *Cyperus rotundus* and *Polygonum spp.* (Tuboi et al. 2015). Highest productivity reported was that of *Zizania latifolia* and formed approximately a third of the diet of Sangai while graminoids formed 80% of the diet of the species (Tuboi and Hussain 2014). Singh, (1991) reported 233 plant species belonging to more than 58 families forming part of the diet of brow-antlered deer. They exhibit a bi-modal activity pattern with foraging peaks at early morning around 0430 hrs-0800 hrs and 1500 hrs – 1800 hrs in the evenings (Hussain et al. 2004).

Social Organization and Behaviour

Details on the social organization and behavior patterns of the sub-species are not available; however information on a closely related sub-species *Rucervus eldii thamin* as described by Aung et al. (2001) suggest that the adults are solitary with males and females coming together during the breeding season, while the female – fawn association is strong and observed throughout the year. Patterns of aggression and reproductive behavior as described in literature are similar to that described for other deer species, with a high frequency of aggressive encounters between males occurring during the rutting season for establishing social hierarchy. Male display behavior includes scent marking by rubbing the pre- orbital organ on the bushes and thrashing vegetation with their antlers and forelegs (Hussain et al. 2004).

Reproduction

They are seasonal breeders with a peak reproductive activity during March. Dominant stags identify and associate with estrous females. Mating takes place when the does are at the peak of their estrous cycles (Hussain et al. 2004). A single fawn is usually born after a gestation of 213 days with new-born fawns concealed in vegetation (Hussain et al. 2004). Does provide parental care till the fawns start walking

independently (Singh 1993) with fawns feeding on grass by fourth week and are weaned by the end of the fourth month (Hussain et al. 2004).

Distribution

The subspecies *Rucervus eldii eldii* has an extremely limited distribution range and is restricted to a single location, the Keibul Lamjao National Park, of Manipur (Figure1: Circled in red). The total area of the park is 40 km²; however, the actual area utilized by the animals is only about 15 km² (Hussain et al. 2004).

Threats and Conservation Status

Sangai are threatened by the degradation of their unique ‘Phumdi’ habitat at the single location – Loktak Lake due to the construction of dam that limits the seasonal changes in water level crucial for the uptake of nutrients from the bottom by the *phumdi*. An additional cause for concern is the absence of nucleotide diversity in both the captive and free ranging populations (Angom et al. 2017). This has led to both the captive and wild populations being represented by a single haplotype (Angom et al. 2017). They are accordingly listed in Schedule I of the Wildlife Protection act; the IUCN Redlist of threatened species has listed it as Endangered based on a species wise assessment (Gray et al. 2015).

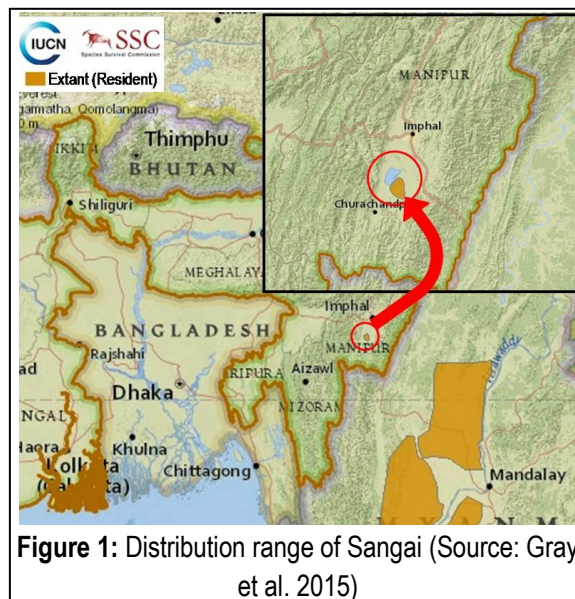

Figure 1: Distribution range of Sangai (Source: Gray et al. 2015)

Efforts to ensure the long-term survival of the species are underway with a project initiated under the WII-CAMPA Species recovery project for Sangai, a collaborative initiative of the Wildlife Institute of India and the Department of Forests, Government of Manipur. As a part of the initiative further detailed studies are planned to understand and address the genetic as well as demographic threats that threaten both *in-situ* and *ex-situ* populations.

Status in Captivity

The subspecies *Rucervus eldii eldii* is presently not reported from institutions outside India. In India the species is held at 6 institutions with a population of 125 (47.61.17) according to the Species360 database, while CZA inventory for 2016 – 2017 records the

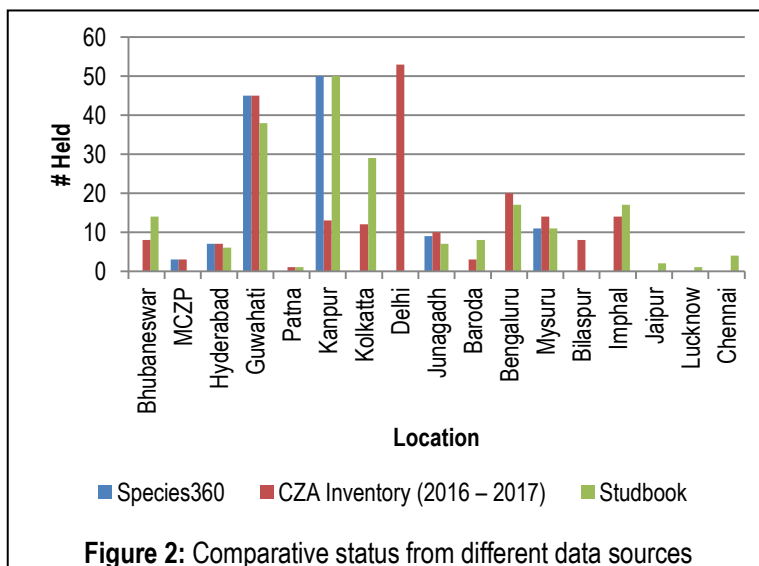

Figure 2: Comparative status from different data sources

sub-species at 14 zoos with a population of 211 (75.101.35). The studbook based on data made available by holding institutions and the Taxon report of the sub-species from the Species360 website records a presence of 205 (86.98.21) specimens at 14 zoos. A comparison of the status of Sangai in captivity based on the different data sources is presented in table 2 and figure 2.

Methods

Data on individual history was collected by means of questionnaires, zoo visits and from the websites of CZA and Species360. Questionnaires were sent to the institutions housing Sangai in India, requesting information for each captive specimen. Data was entered in the Single Population Analysis and Records Keeping System (SPARKS v 1.66) (ISIS 2004) and subsequently exported to population management programme PMx v 1.2 (Ballou *et al.*, 2011) for further analysis.

Scope of the Studbook

- The CZA inventory was used as a benchmark for population estimates and deviations from the same (Table 2) are attributed to unavailability of required information from holding institutions though repeated requests for the same were made.
- The studbook includes all specimens present in Indian zoos for which records were available from holding institutions. Efforts were made to retrieve information on their holding from the taxon report of the species from the Species360 website for institutions from which records were not received
- The mnemonics present in the SPARKS software were used as names for individual institutions; while for those institutions for which mnemonics were not present in the SPARKS Software, the same were assigned based on their location listed on the CZA Website and the same are listed in the location glossary (Appendix IV).
- The studbook includes specimens with incomplete transaction histories, including location at which they were held/ acquired from. For all such transactions the mnemonic INDIA has been used.
- The mnemonic MANIPUR has been used for specimens that have been acquired from wild.
- Data from Mahendra Chaudhury Zoological Park, Mohali 3 (1.1.1) and National Zoological Park, Delhi 53 (14.29.10) was in the form of an inventory with no information on individual specimens and thus not amenable for entry in SPARKS. The same was accordingly not included in the SPARKS database. Individual records of these locations that were available from transactions between institutions were however recorded in the database.

Analysis

Historical Population

The studbook includes 566 (235.244.87) specimens housed at 15 Indian zoos. The first recorded entry of the sub-species in captivity was at Alipore Zoological Garden, Kolkatta with a pair of animals being acquired by the zoo from the wild. Growth in the population has been primarily due to captive births (figure 3) with only two wild origin specimens [2 (1.1.0)] contributing to the population. The historical population of 566 (235.244.87) specimens is mainly an outcome of captive births attributed to 66(28.38) individuals contributing to the population. The population since its inception has also witnessed 258 (147.144.67) deaths. The sex ratio is approximately equitable in the population since its inception. Figure 3 and Table 3 summarize the trends of the historical population while Annexure I includes detailed event-wise information on individual specimens.

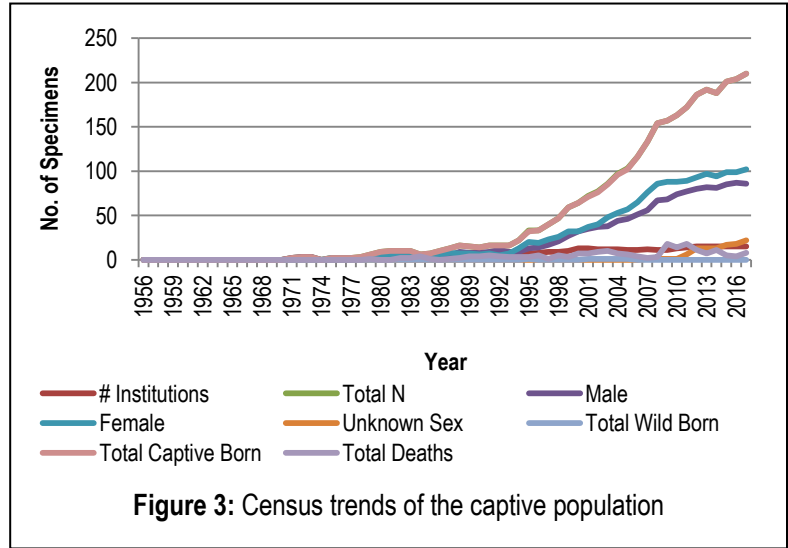

Table 3: Summary of the Historical Population

	Males	Females	Unknown	Total
Studbook size	235	244	87	566
Acquisition from wild	1	1	0	2
Deaths	147	144	67	258
Breeding individuals	28	38	0	66
Lost to follow up/ released	2	1	0	3

Living Population:

The living population includes 205 (86.99.20) specimens housed at 15 institutions; with no wild origin specimens. Only 11.7% or 24 (9.15.0) animals are proven breeders in the living population. Table 4 summarizes the status of the living population while Annexure II provides location-wise specimen details of the living individuals. A perusal of Table 2 and Annexure II reveals the presence of populations capable of breeding at six locations with Manipur Zoological Garden, Imphal and Assam State Zoo and Botanical Garden, Guwahati located in close proximity to the natural distribution range of the species.

Table 4: Summary of living population

	Males	Females	Unknown	Total
Living	86	99	20	205
Wild-born	0	0	0	0
Captive-born	86	99	20	205
Breeding	9	15	0	24

Population Vital Rates

The population is currently declining at a rate of approximately 15% annually with females showing a faster decline of approximately 17%. The captive population has a long generation time of 8.2 years, a consequence of its natural history (sexual maturity at approximately four years). The declining population trend is also reflected in the projected population after 20 years with a loss of a large proportion of the population.

The accuracy of the life table analysis carried out to arrive at the conclusions is however limited by the small number of known age specimens in the population.

Table 5: Vital rates of the captive population

	Males	Females	Total
λ : Population growth rate	0.868	0.832	0.850
T: Generation time	8.6 years	7.8 years	8.2 years
N 20: Projected population after 20 years	13	16.4	29.4

Age Distribution:

Age distribution of 185 (86.99) known age living specimens indicates a female bias. The living population includes 173 (71.83.19) animals in reproductively active age classes (>4 – 14 years; Figure 4); however, only 24(9.15) specimens have actually contributed to the population. It also shows the presence of 22 (8.14.0) specimens of either sex in the post reproductive age class. A comparison of table 3 and figure 4; however, indicates that while a significant number of animals are in reproductively active age classes, only a small proportion of the individuals are effectively contributing to the growth of the population leading to the observed decline.

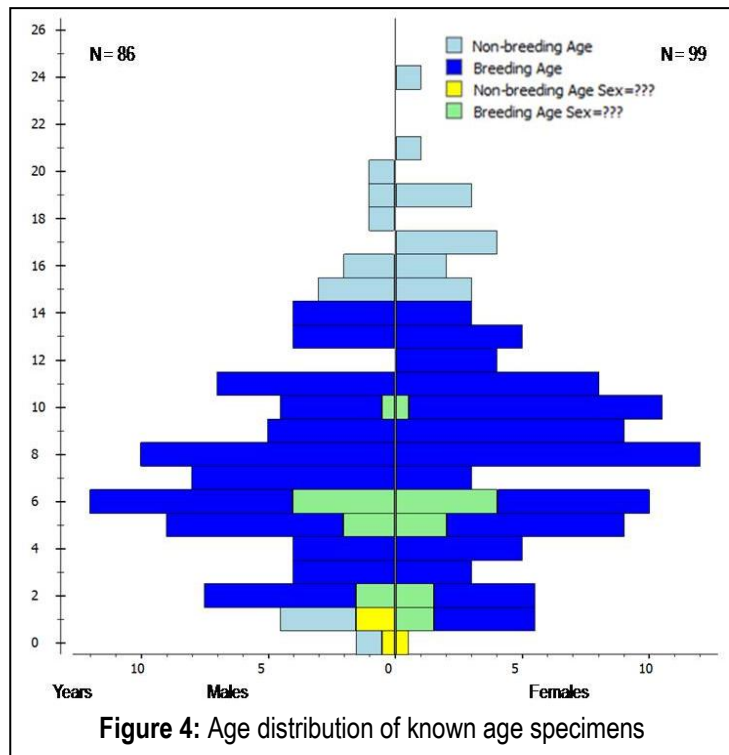

Figure 4: Age distribution of known age specimens

Genetic Status

Table 6 summarizes the genetic status of the living population. Analysis indicates that it originates from only 2 (4.7) founders. The living population of 205 (86.99.20) specimens retains the limited genetic diversity of these two animals

Table 6: Genetic Summary of the current population

Genetic parameters	Current
Founders	0
Living Animals	205
Percent Ancestry Known	0%
Gene Diversity (GD)	0%
Population mean kinship (Mk)	1.00
Founder genome equivalents	0.50

only. Limitations to effective record keeping due to inadequate marking of individual specimens are reflected in the lack of information on the genetic status of the captive population. The small founder base also indicates that the current population is very closely related to each other with progeny being offspring of mother – son, father – daughter, and sibling pairings. The same is also indicated by the high value of population mean kinship. An additional cause of concern is the genetic bottleneck that the free ranging population is facing, thereby limiting the acquisition of additional founders for augmenting the genetic diversity of the population.

Constraints in Population Planning

Analysis carried out for development of a population management plan and breeding recommendations revealed that parentage information is available for approximately only 19% of the population (Annexure I and Annexure III). The individuals whose parentage is known also have an ancestry of unknown parents. The limited founder base of the captive population and the homozygosity of both the captive and free ranging populations as suggested by Angom et al. 2017 further constrain the availability of new founders that can augment the limited genetic diversity present in the population.

Studies being carried out under the WII-CAMPA Species recovery project for Sangai can enable a better understanding of the actions needed to ensure their effective management.

Conclusions and Recommendations

Sangai (*Rucervus eldii eldii*) is a critically endangered sub-species of *Rucervus eldii*. A small free ranging population is known to exist at a single location – the Keibul Lamjao National Park in Manipur. The population is critically threatened by loss of habitat and genetic bottleneck that it has undergone. Accordingly, maintaining demographically stable and genetically viable *ex-situ* populations is critical for ensuring the long-term survival of the species.

The captive population though larger in size and distributed across multiple institutions is equally prone to extinction due to the extremely limited genetic diversity present in it. An additional cause of concern is the limited information available on individual specimens. Effective management of the captive population requires intensive management efforts aimed at:

Record keeping and marking

The zoos holding the sub-species in captivity must ensure individual animal identification and effective record keeping for developing population management plans.

Assessment of genetic status

Limited information on parentage limits development of population management plans for the sub-species in captivity. The use of appropriate molecular genetics tools to assess the genetic status of the captive population and understand relationships between individuals would assist in development of a population management plan.

Bio-technological interventions

Both the captive and free ranging populations have been reported to have a limited genetic diversity (Angom et al. 2017), thus augmentation of the captive population with additional founder animals would have minimal benefits. Institutions outside India have developed bio-technological interventions that are needed for effective conservation of the species/sub-species. Collaboration/technology transfer from these institutions can be of great importance in effective management of the sub-species in India.
