FOREWORD

For species threatened with extinction in their natural habitats, ex-situ conservation offers an opportunity for ensuring their long-term survival. Maintaining genetically viable and demographically stable populations in captivity can ensure their sustained survival. This can be ensured by using pedigree information contained in studbooks that form the key to understanding the demographic and genetic structure of populations and taking corrective actions as required for effective management of captive populations. Studbooks also provide an insight into the mating choices that can be exercised to maximize retention of genetic diversity.

The Central Zoo Authority (CZA) has initiated a conservation breeding program for threatened species in Indian zoos. As a part of this endeavor a Memorandum of Understanding has been signed with the Wildlife Institute of India for compilation and update of studbooks of identified species in Indian zoos.

As part of the project outcomes the WII has compiled an updated National studbook for Asiatic lion (*Panthera leo persica*) in Indian zoos. The population management recommendations contained in the studbook should form the basis for the long term management of the species in captivity. It is hoped that the zoos will adopt the recommendations and keep the WII informed of changes in their populations on a regular basis to enable the timely update of the studbook.

(B.S. Bonal, I.F.S.)
Member Secretary
Central Zoo Authority

ACKNOWLEDGEMENTS

This report is a part of the assignment to the Wildlife Institute of India, Dehradun by the Central Zoo Authority, New Delhi on the development and maintenance of studbooks of selected endangered species in Indian zoos.

The authors are thankful to the Central Zoo Authority for the financial support in carrying out the assignment. The guidance and support extended by Shri. B.S. Bonal IFS, Member Secretary, CZA is gratefully acknowledged. The authors also thank Dr. Brij Kishore Gupta, Evaluation and Monitoring Officer, Dr Devender Singh, Scientific Officer and the support staff of the Central Zoo Authority for facilitating this work.

The valuable advice and support provided by Dr. V.B. Mathur, Director, WII and Dr. P.K. Mathur, Dean Faculty of Wildlife Sciences, is duly acknowledged. We also thank Mr. Mukesh Arora for providing secretarial assistance in formatting this document.

We acknowledge the support from zoo directors, biologists, curators and veterinarians from the following contributing zoos for providing pedigree information that led to the successful establishment of the studbook.

1. Asiatic Lion: Biology and Status

1.1 Taxonomy of Asiatic lion

Kingdom	Animalia
Phylum	Chordata
Class	Mammalia
Order	Carnivora
Family	Felidae
Scientific Name	<i>Panthera leo persica</i>
Infra-specific Authority	(Meyer, 1826)
Common Names	Asiatic Lion, Indian lion, Babbar Sher (Hindi) etc.

1.2 Biology

1.2.1 General Characteristics

The animal is tawny with a paler belly, and the abdomen and inner-side of legs white. The males are larger than females and have a pronounced mane. The Asiatic lion differs from its African con-specifics in having a prominent belly fold and being slightly smaller than African subspecies (Pocock 1930 and Haas *et. al.* 2005). The males have a less pronounced mane than their African counterparts with the ears are clearly visible (Pocock 1939).

Table 1: Biological attributes of Asiatic lion

Attributes	Males	Females
Body weight	160 – 190 kg	110 – 120 kg
Age at first reproduction (free ranging)	5 – 8 years	4 years
Age at first reproduction (in captivity)	3 – 4 years	2 – 3 years
Longevity	Approximately 16 years	Approximately 17 – 18 years
Gestation period	116 days approximately	
Litter size	Ranging from 1 – 5 cubs	

(Source: Haas *et. al.* 2005)

1.2.2 Habitat

Lions primarily inhabit the Gir landscape of Gujarat that has a dry deciduous forest cover interspersed with, moist mixed riverine valley forest patches along the perennial rivers and tropical thorn forest (Berwick 1976). They avoid the intense midday heat and human activity by remaining in the cooler mixed forest riverine patches during day time. Emerging out from these areas in early mornings or in evenings when temperatures and human activity are lower (Jhala *et. al.* 2009).

1.2.3 Feeding ecology and behaviour

Chital (*Axis axis*); is the most common prey, however; Sambar (*Rusa unicolor*); larger in size is the preferred prey species (Chellam 1993; Khan 1994). The females and male coalitions cooperate to hunt prey. Larger preys are preferred over the smaller prey by females with prides; while single males or male coalitions may show preference for smaller sized prey (Johnsingh and Chellam 1991).

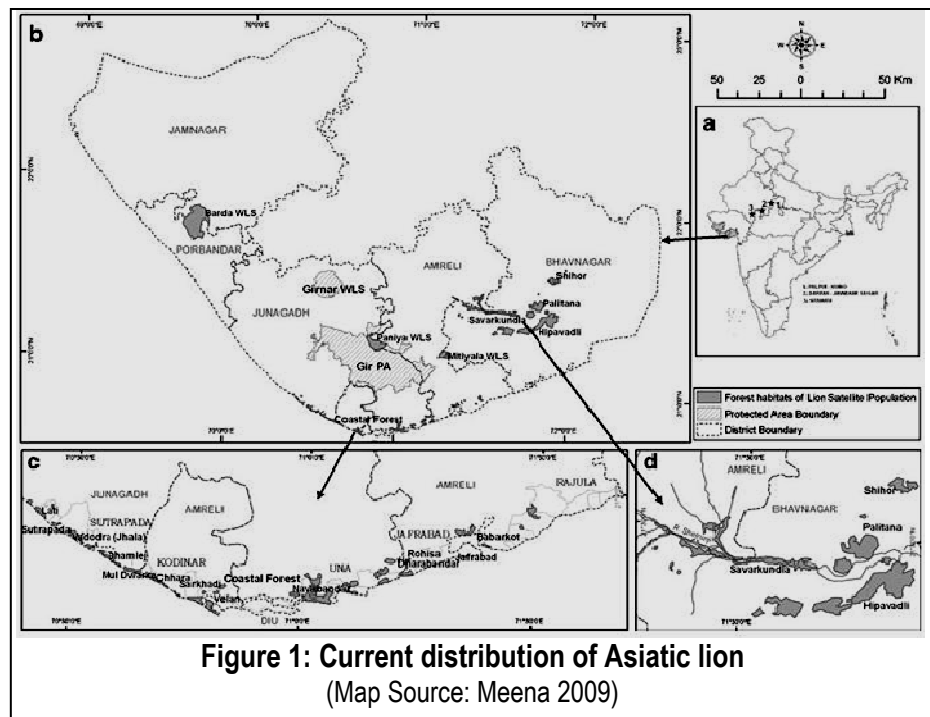

1.2.4 Social organization and behaviour

They are social animals living in prides of 2 or more than 2 females and 1 or more adult males with cubs and sub-adults. The prides are matrilineal with the males dispersing on reaching adulthood. Related or unrelated males associate to form groups to hunt and challenge existing dominant males in prides. The social organization of Asiatic lions differs from African lions in that breeding lionesses defend resource based territories while male coalitions maximize coverage of female groups. Males generally associate with their pride females only when mating or on a large kill (Jhala et. al. 2009). The reproductive behaviour of the sub-species is similar to other large felids with the males locating females in estrous and the females initiating sexual activity. Meena (2010) has described their reproductive behaviour to include the indication of her reproductive status by vocalizations and scent marking; location of females in estrous by the male/ male coalition, followed by a brief courtship. After this the females presents her posterior to the male for intromission. After ejaculation the male dismounts and there is a brief aggressive interaction involving female vocalization and the male moves a little distance away and rests. The females rolls over and rests for a while. This process is repeated several times with the frequency waning towards the end of 3 – 7 day period of reproductive activity.

1.3 Distribution

The Asiatic lion had a distribution ranging from Greece, Syria in the west through Iraq, Iran, Pakistan and up to India in the east. Within India during the past hundred years lions were distributed through the present day states of Rajasthan, Gujarat, Haryana, Punjab, Uttar Pradesh and Madhya Pradesh.

Today the Asiatic lions have been reduced by hunting and habitat loss to a single population in the Gir forests of Gujarat (Chellam and Johnsingh 1993).

1.4 Threats

The species currently exists as a single population, and are vulnerable to extinction from random catastrophes, such as an epidemic or a large forest fire. The current population is growing at a steady rate and some of the animals are dispersing out of the Gir area into areas with intensive agriculture and poor prey base, resulting in predation on domestic livestock. While current tolerance levels of lion – human conflict are high due to intensive compensation programmes (Bannerjee et. al. 2013) they may change in future as the growing population of lions continue to disperse outside the protected area

system and the level of conflict increases, this may lead to lions being poached (Breitenmoser et. al. 2008).

1.5 Status of Asiatic Lion

Census conducted by the Gujarat Forest Department in 2005 and 2010 revealed the existence of 359 and 411 adult lions respectively in a greater Gir landscape comprising of the Gir National Park and adjoining forest and revenue lands in Junagadh and neighboring districts. Based on the low population level the species has been listed as:

- Endangered D ver 3.1 IUCN Red List, 2008 (Breitenmoser et. al. 2008).
- CITES Appendix I and
- Schedule I of the Wildlife Protection Act (1972) GOI.

1.6 Status in captivity

The studbook includes a historical population of 767 (332.381.54) with the current population of 162 (77.84.1) specimens held in 21 Indian zoos in India. These also includes 3 (2.1) animals released to the wild and 6 (3.3) animals transferred to foreign zoos. The details of the current population are summarized in tables 2 a & b and figure 2. The status of Asiatic lion in captivity is based on the data received till December 2013.

2. Methodology

2.1 Collection and organization of pedigree information from zoological institutions in standardized formats:

The pedigree information on individual specimens was collected through mailed questionnaires, field visits to zoos and from the websites of CZA and Zoological Information Management System (ZIMS). The data collected from holding zoos was entered in Single Population Analysis and Records Keeping System (SPARKS v 1.66) (ISIS, 2004). Studbook numbers were assigned to individual specimens on the basis of their chronology in captivity. The data was then validated in SPARKS for checking the accuracy of data entered. This data was exported to PMx v 1.2 (Ballou *et al.* 2010) which was then used as input in PMx for further demographic and genetic analysis.

2.2 Developing population management plans for managing Asiatic lion in captivity:

Since, demographic and genetic analysis provides details of respective status of the current population; these were used for identifying demographic and genetic targets for the population. Population management plan and pairing options were also developed using the goals and pairing option of PMx.

2.3 Scope and Assumptions of the Studbook

The current population of Asiatic lion in Indian zoos comprises of 153 (73.79.1) individuals. Three animals were released into the wild and six animals have been moved out of the Indian region. These have also been included by SPARKS in the files exported for analyses by the PMx software for further demographic and genetic analyses. *This inclusion is due to the software and not intentional.* The current location of the animals is listed at the end of table 2 as animals moved out of the Indian region.

3. Status of living Asiatic lion in Indian Zoos

The living population of Asiatic lion in Indian zoos is presented in table 3. The bulk of the population is maintained at Sakkarbaug Zoo, Junagadh; with Nehru Zoological Park, Hyderabad and Rajkot Zoo, Rajkot also making important contributions. The historical listing and pedigree charts of the Asiatic lion population are placed as Appendix I and II respectively.

4. RESULTS

4.1 Demographic status of the Asiatic lion population in Indian zoos

The description and prediction of population growth and age structure is of importance in developing species specific management plans for maintaining stable long term populations. The census trends, age distribution and population growth rates based on life table analyses are discussed below and the outcomes of these analyses have been used to develop long term population management plans.

4.1.1 Census trends

The census trends of the captive Asiatic lion population are summarized in figure 3. The figure indicates a steady growth in population size with captive born animals forming the bulk of the population after 1971. The current population has approximately 20% animals of wild origin.

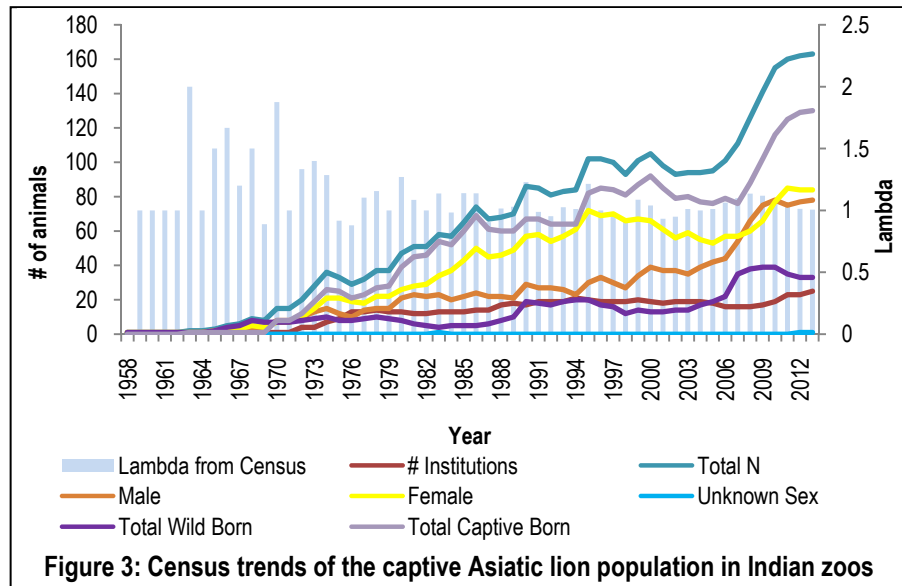

Figure 3: Census trends of the captive Asiatic lion population in Indian zoos

Equal sex ratio was observed from 1958 – 1967, however; a male biased sex ratio was observed from 2007 – 2010. The population was biased towards females from 1967 – 2007 and again from 2010 onwards. The number of zoos holding the species in captivity has increased from the initial single location to the current 21 zoos.

The historic average growth rate λ (lambda) from census (Figure 3) indicates that the species during its tenure in captivity has shown moderate change and had a stable size for almost 25 years. The population however, has also shown rapid increase during 19 years. During its initial history in captivity, the large values of ' λ ' obtained were the artifacts of the small population size; that result in even small changes being reflected as high values of lambda. The population has shown declining trends (11 years) over a part of its tenure.

When $\lambda > 1.00$, the population is increasing; when $\lambda < 1.00$, population is decreasing; and when $\lambda = 1.00$, the population is stable. The difference between the value of lambda and 1.00 indicates the magnitude or annual rate of change

4.1.2 Age Distribution

The Asiatic lion population in Indian zoos has a large proportion of individuals in the reproductively active age classes with 91% of the females of the age classes 21/2 to 14 years and 80% of males in age classes of 3 to 16 years. The proportion of individuals in the age class that most animals actively reproduce includes 3 – 9 years for females (42%) and 4 – 15 years for males (53%).

The population consists of 21 males and 13 females in the reproductively senescent age classes and 5 males and 10 females in the pre-reproductive age classes. These latter individuals as they grow have the potential to contribute to the growth of the population. The above results suggest that the population is steadily increasing and has the potential of rapid growth. However; if the population size is to be maintained at current levels, reproductive activity needs to be regulated to allow selected pairs to reproduce each year. This will ensure the desired slow rate of population increase while lengthening generation length leading to a slower loss of genetic diversity with time.

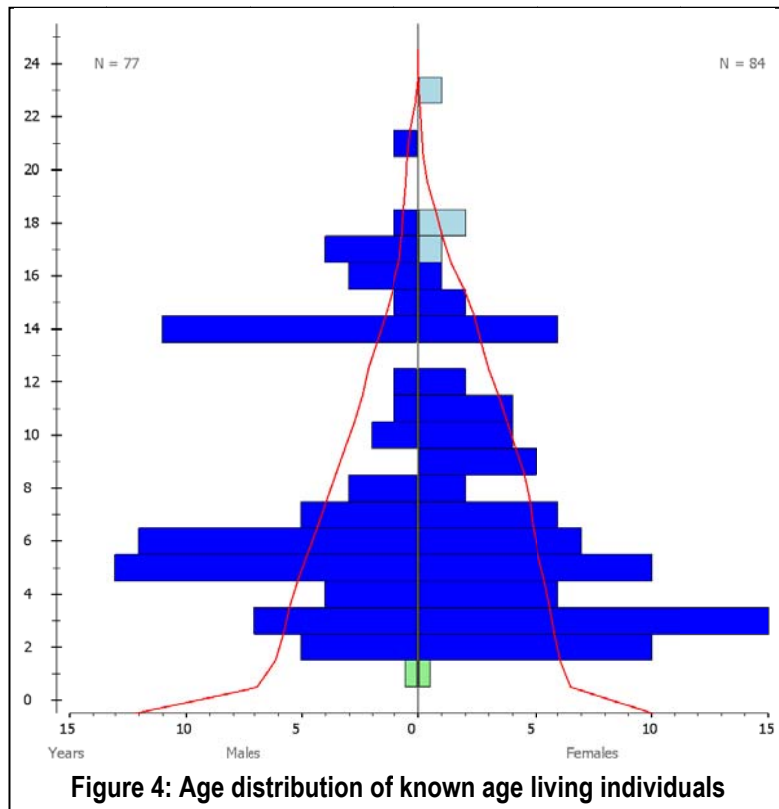

Figure 4: Age distribution of known age living individuals

4.1.3 Life Table Analysis

For many species, males and females have different age- related patterns of reproduction and mortality. A population growth is determined by how these different age- specific patterns of birth and death rates interact with the population's structure. These differences are summarized in a life table (Caughley 1977; Ebert 1999). It displays the vital rates *viz.* mortality (Q_x); fecundity (M_x) and related rates for each age class separately for males and females. Additionally life tables help in identifying vulnerable age classes in population and developing management strategies to counter this vulnerability.

4.1.3.1 Fecundity rates (M_x)

The reproductive life span of the captive Asiatic lion population is indicated by fecundity rates presented in figure 7. It suggests that the females are reproductively active by 2.5 years of age and remain so till 13.5 years of age; however peak reproductive activity is observed from 4 – 9 years of age. Reproductive activity declines after the ninth year and reproductive senescence sets in by the 14th year of life. For males, the age of

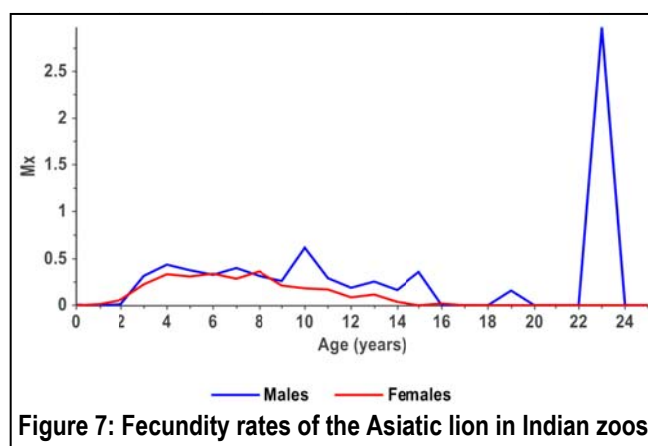

Figure 7: Fecundity rates of the Asiatic lion in Indian zoos

onset of reproductive activity is also 2.5 years of age; however they continue to be reproductively active for longer till 15 years of age when they become inactive. Additional peaks observed after 15 years for

reproductive activity in males are outliers and can be ignored as the number of individuals is too small and the graph represents the proportion of individuals in each age class.

4.1.3.2 Mortality Rates

Age- specific patterns of mortality (Q_x) for males and females show very high levels of neonatal mortality. Mortality rates remain high for the first year of life and decline after that to peak again in the 11th year for males and 13th year for females. Thereafter mortality rates show alternate peaks and troughs till the 21st year for males and 22nd year for females which is the maximum longevity recorded for known age individuals in the Indian population.

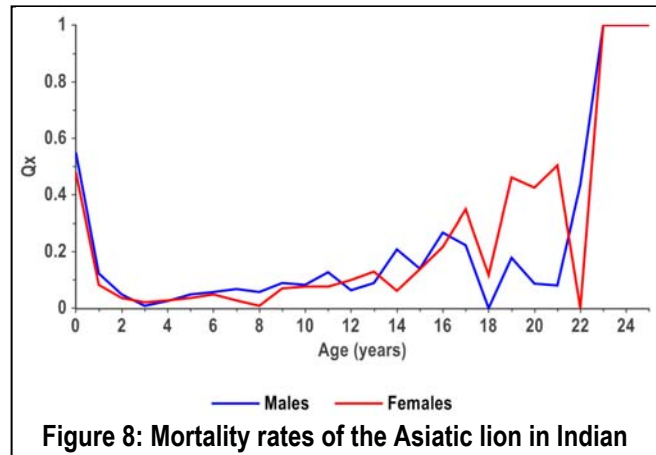

Figure 8: Mortality rates of the Asiatic lion in Indian

4.1.3.3 Age- specific patterns of survivorship (l_x)

Age- specific patterns of survivorship (l_x) indicate the median survivorship of a population. Females have 50% likelihood of surviving beyond the first year of life whereas for males the higher mortality in the first year of life suggests that approximately 45% of the animals are likely to survive beyond the first year of life. In the age classes between one – 19, females have a higher survivorship rate; while males have greater chances of surviving in the higher age classes. The survivorship patterns of the population suggest that animals below one year of life are most vulnerable.

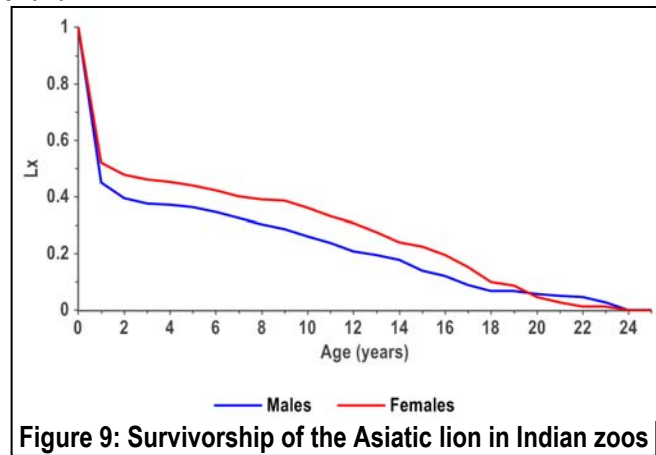

Figure 9: Survivorship of the Asiatic lion in Indian zoos

4.1.3.4 Population growth rates:

The population shows a positive growth rate (for (r) the instantaneous rate of change and (λ) the proportional change in population). Similar values for both the population growth measures show a demographically stable

population with little change in the demographic characteristics of the population. Males show a higher growth rate for both the measures of growth. The generation time for males is longer than that for females. The generation time is relatively longer for the species as compared to the first age of reproduction. This indicates that a lower rate of loss of genetic diversity over time due to the fewer generations required for achieving demographic goals.

Table 5: Vital rates of the Asiatic lion population

Life Table Summary	Total	Males	Females
r	0.018	0.027	0.010
λ	1.019	1.027	1.010
T	7.7 years	8.3 years	7.1 years

r : Instantaneous rate of change of the population, averaged for males and females. If $r > 0$, the population is increasing; if $r < 0$, it is decreasing.

Lambda (λ): The proportional change in population size from one year to the next based on life table calculations (expected lambda), averaged for males and females. Lambda > 1 for increasing populations; lambda < 1 for declining populations.

T : Mean generation time (averaged for males and females), which is the average age of reproduction (production of offspring). It is also the average time from reproduction in one generation to reproduction in the next generation. T is not the age of first reproduction.

4.2 Genetic status of the Asiatic lion population in Indian zoos

An important prerequisite for maintaining threatened species in captivity is ensuring the retention of maximum possible genetic diversity from the free ranging population. The Asiatic lion population in Indian zoos fulfills this criterion as it has retained approximately 96% of the genetic diversity of the original founders. It has 39 founders contributing to the captive population and an additional 20 potential founder animals that if judiciously used can increase the gene diversity of the population to 99%. The relatedness within the population has also been maintained at a low level as indicated by the values for population mean kinship and mean inbreeding.

Table 6: Genetic Summary of the Asiatic lion population in Indian zoos

Parameters	Values
Founders	39
Potential (additional) Founders	20
Living Animals	162
Living Descendants	123.00
% Ancestry Known	98%
% Ancestry Certain	98%
Gene Diversity	0.9632
Population Mean Kinship	0.0368
Gene Value	0.9624
Founder Genome Equivalents	13.57
Founder Genomes Surviving	28.04
Potential Gene Diversity	0.9901
Mean Inbreeding	0.0266
Ne/N	0.1686

Genetic variation retained in populations is the basis for adaptive evolution and maintains the population's potential to adapt to environmental change. Several studies indicate a general, positive relationship between genetic variation and both individual and population fitness (Vrijenhoek 1994; Frankham 1995; Saccheri et al. 1998 and Lacy 2009). Following sections discuss the details of contributions made by wild origin animals to the captive gene pool.

4.2.1 Founders

The Asiatic lion population in Indian zoos was founded with wild origin individuals and included relatively few individuals in captivity till 1970 when the captive population started reproducing and the population started growing. The status of wild origin animals present in the population at the end of each decade since inception is 1958 – 1; 1967 – 5; 1977 – 9; 1987 – 6; 1997 – 16; 2007 – 35; and at the end of 2013 the population contained 33 wild origin animals.

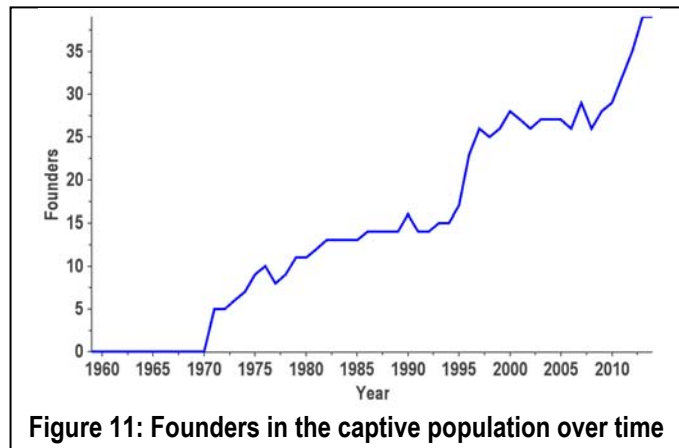

Figure 11: Founders in the captive population over time

Founders: Wild origin animals are usually considered founders, if they reproduce. However; they are treated as potential founders before contributing genetically to the captive population. Accordingly not all wild origin animals included in the population can be considered as founders.

Founder Genome equivalents: Any loss of founder genetic diversity by way of skewed founder contributions and genetic drift can be explained by founder genome equivalents (fg) (Lacy 1989, 1995). It is the number of founders required to obtain the levels of genetic diversity that are observed in the current population if the founders were all equally represented and had retained all their alleles in the living population.

Gene diversity retained: Gene diversity (GD) is the level of expected heterozygosity in a population. GD ranges from 0 to 1 and is one of the principal measures of genetic diversity in populations. For captive breeding of threatened species the proportion of heterozygosity (introduced by way of wild origin animals) surviving in the current population is of importance.

Founder contribution: It is the percentage of an individual's or population's genes that have descended from each founder.

Allele retention: Genetic contribution by founders through only one or a few animals may cause their elimination due to the failure of the progeny to reproduce or produce only a few offspring.

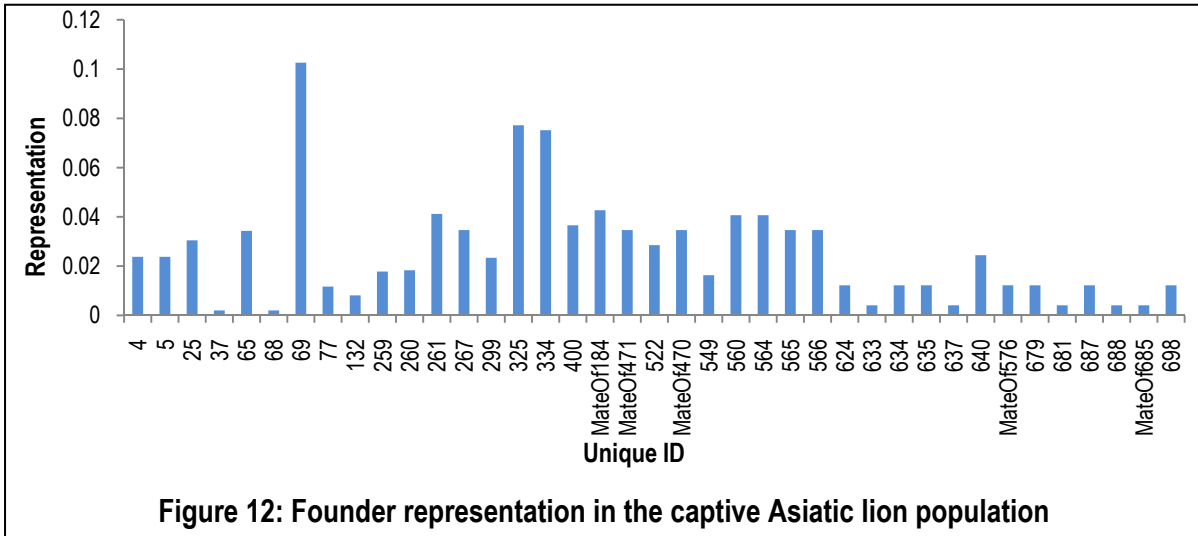

Inbreeding: Inbreeding is the mating of related individuals. Off-spring of related parents will be inbred; with closer the relatedness of parents higher the level of inbreeding. It is measured by its inbreeding coefficient (f), which is the probability of receiving the same allele from each parent. Mean inbreeding is the average of inbreeding coefficients of all animals in the current population and is an indicator of the overall inbreeding level.

Potential genetic diversity: Living founders that have produced only a few off-spring, or living animals that have no descendants in the population but are still capable of reproducing, represent individuals that can still potentially contribute to genetic diversity of the population by producing additional offspring.

Effective population size (N_e): The extent and rate of loss of gene diversity is dependent on the genetically effective population size (N_e) of a population. It's a measure of the population's capacity to maintain genetic diversity over generations is termed as effective population size. Genetic diversity is lost at the rate of $1/(2N_e)$ per generation. It is

4.2.2 Founder Statistics

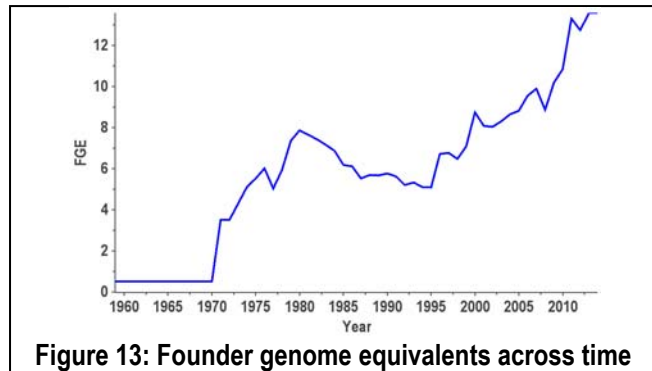

Ensuring an equal representation of the genetic diversity brought in by each founder animal is crucial for maintaining the same levels of genetic diversity in the captive population as sampled from the free ranging population. However; it is difficult to achieve this as some animals are highly successful in breeding and overrepresented at the expense of other animals. Figure 12 presents the genetic representation of wild origin animals in the captive gene pool. It suggests that a few animals are grossly overrepresented in the living population while others are under-represented. Further a total of 106 wild origin animals have failed to contribute their genes to the captive population. The animals which have

not contributed to the gene pool include 23 animals that are alive and 18 animals that are in the breeding age based on age assumptions provided. The remaining wild origin animals have passed on without making any contributions to the captive population and the genetic diversity retained in them has been permanently lost. Founder contribution and allele retention follow similar trends. Future breeding plans must ensure a better representation of the under-represented and non-represented lines.

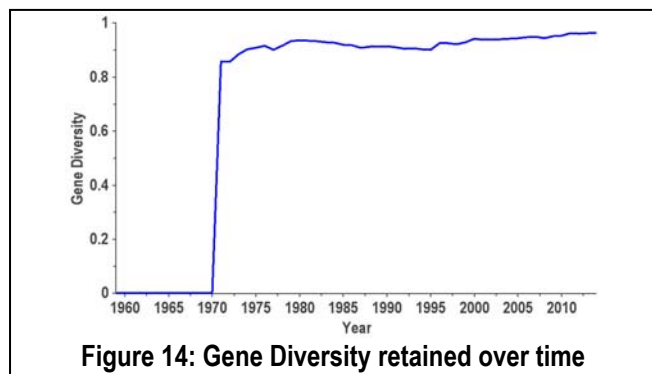

4.2.3 Founder genome equivalents

The founder genome equivalents (Figure 13) of the Asiatic lion population in Indian zoos show trends similar to inclusion of founders over time. This indicates that the loss of genetic diversity due to skewed founder contribution and genetic drift is minimal and not a cause of concern.

4.2.6 Gene diversity retained

The Asiatic lion population in Indian zoos continues to retain a high level (more than 90%) of genetic diversity after the initial founding phase (Figure 14). This has been brought about by the inclusion of a large number of founder animals in the population and equitable allele retention due to the complex pedigrees of the founder animals.

4.2.7 Inbreeding

Figure 15 presents the mean inbreeding in the Asiatic lion population in Indian zoos since its inception. The population shows a rise in inbreeding levels after 1980 which peaked in 1998 and 2007 with a slight decline in between. The inbreeding levels have started declining once again since then. The

presence of a large number of founders; a large population size and appropriate mating choices continue to maintain low levels of inbreeding in the captive population. Table 7 presents the inbreeding coefficients of individual specimens since the inception of the population. A large proportion (N = 618) of the population is not inbred (f = 0); few (N = 19) have low levels of inbreeding (f <= 0.0625); However 95 individuals have inbreeding coefficients above 0.0625.

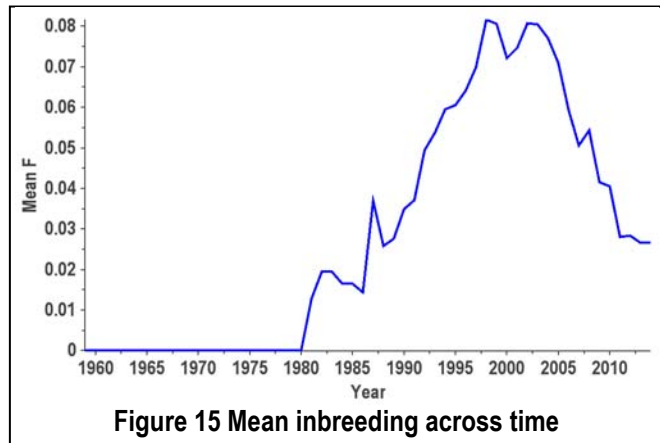

Figure 15 Mean inbreeding across time

Individuals with unknown ancestry (N = 35) are placed at the end of table as animals with unknown inbreeding coefficients as inbreeding coefficients can be calculated only for individuals of known lineage.

Table 7 Inbreeding coefficients in the Asiatic lion population in Indian Zoos

Inbreeding coefficient	Sex	Unique ID
0	Female	1, 3, 5, 6, 9, 11, 12, 16, 17, 18, 21, 22, 23, 24, 25, 26, 27, 37, 38, 40, 41, 42, 44, 45, 55, 59, 60, 61, 62, 63, 64, 65, 67, 71, 75, 76, 77, 79, 82, 85, 86, 89, 91, 93, 95, 96, 97, 100, 101, 102, 103, 104, 106, 109, 114, 116, 117, 119, 122, 128, 129, 130, 132, 134, 135, 136, 137, 140, 144, 145, 146, 148, 149, 152, 153, 155, 162, 167, 173, 174, 175, 176, 183, 184, 201, 203, 220, 223, 229, 234, 241, 244, 246, 247, 251, 252, 255, 259, 260, 261, 263, 266, 267, 268, 269, 270, 276, 277, 278, 285, 286, 287, 289, 293, 299, 303, 304, 310, 311, 313, 314, 315, 320, 321, 324, 329, 330, 331, 332, 333, 335, 336, 338, 341, 348, 349, 356, 357, 361, 362, 363, 364, 365, 367, 371, 372, 375, 376, 377, 379, 381, 390, 396, 399, 402, 403, 405, 409, 410, 411, 412, 413, 414, 415, 421, 422, 437, 439, 440, 442, 443, 444, 447, 450, 454, 456, 457, 458, 463, 464, 467, 468, 470, 471, 486, 487, 489, 493, 494, 495, 496, 497, 498, 500, 502, 505, 509, 513, 514, 521, 522, 524, 526, 527, 528, 529, 536, 537, 538, 542, 543, 544, 545, 546, 550, 552, 561, 562, 569, 571, 573, 575, 576, 578, 583, 584, 585, 588, 589, 593, 594, 595, 597, 601, 603, 604, 606, 607, 609, 610, 611, 612, 618, 622, 623, 629, 630, 631, 634, 637, 640, 643, 647, 649, 650, 651, 652, 659, 662, 673, 676, 677, 679, 681, 683, 684, 685, 687, 694, 695, 697, 703, 705, 706, 709, 714, 715, 717, 718, 719, 722, 723, 724, 727, 729, 730, 731, 733, 734, 736, 737, 739, 740, 741, 743, 744, 746, 752, 753, 754, 755, 756, 757, 769, 770, 771, 776, 777

4.2.8 Potential genetic diversity

The living population of Asiatic lion in Indian zoos has 23 wild origin animals with no contribution to the gene pool (Figure 16). However; only 18 of these animals are in the reproductive age classes and the remaining five animals have reached reproductive senescence.

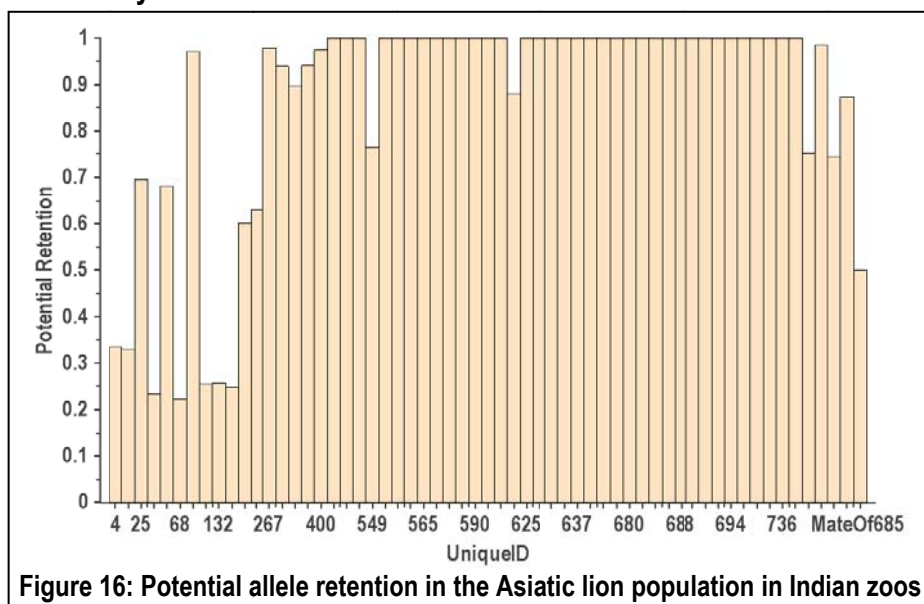

Figure 16: Potential allele retention in the Asiatic lion population in Indian zoos

Equitable

contributions by these animals to the gene pool can further raise the genetic diversity of the population from the current 96% to 99%.

4.2.9 Effective population size (N_e)

The ratio of the effective size to the census size (N_e/M) of the Asiatic lion population in Indian zoos 0.1686 and translates to a genetically effective population size of approximately 28 individuals.

4.3 Targets for population management

Asiatic lion is an endangered persisting as a single free ranging population in the Greater Gir landscape of Gujarat. It therefore becomes imperative to maintain captive populations with the objective of maintaining genetically viable and demographically stable populations for insurance in captivity,

capable of providing surpluses for reintroduction in suitable habitats. The current population in captivity comprises of 162 (77.84.1) individuals (this includes 6 animals that have moved out of Indian zoos). It retains a large part of the genetic diversity (0.9632) introduced by way of founders and is demographically stable. However; the population also includes a significant number of individuals of post reproductive age and is also susceptible to losing genetic diversity due to allelic drift.

Ensuring the long term survival of a species in captivity requires an understanding of the number of animals to be maintained in captivity over time and the supplementation as required with wild origin animals to compensate for loss of genetic diversity.

Simulations using PMx (Ballou *et. al.* 2010) were used to determine the population size needed to be maintained in captivity and the supplementation with wild origin animals required to maintain the genetic diversity of the population. The simulation was run using several scenarios the outcomes of two scenarios are presented here.

4.3.1 Scenario 1

This scenario was run using the current population in captivity and provides an indicator to the genetic and demographic status of the population over the next 100 years. The input variables are summarized in table 8 below and the outcomes of the simulation are presented as figure 17. It indicates that the population can maintain itself at current demographic levels, however; it would only retain the desired genetic diversity over the next 22 years and at the end of 100 years it would retain only 71.5% of the current genetic diversity.

Table 8: Input variables – Scenario 1	
Population Variables	Values

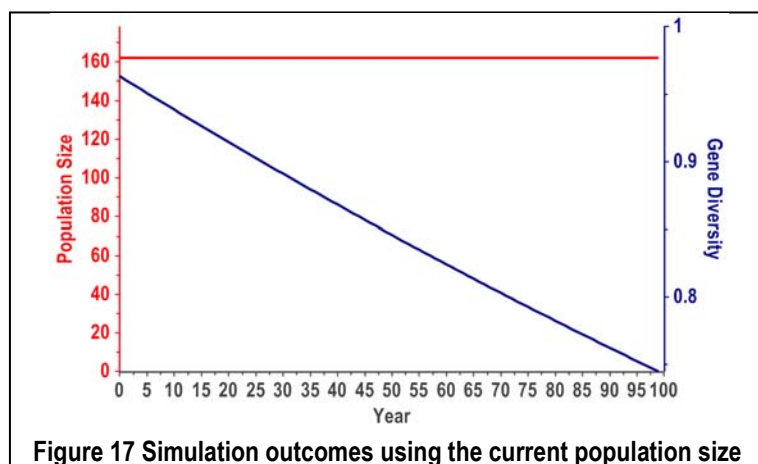

Figure 17 Simulation outcomes using the current population size

4.3.2 Scenario 2

The simulation was run using various intervention options and the one that best allowed the achieving of both demographic and genetic goals of the population involved increasing the maximum population size to 250 individuals and supplementation of the population with 1 wild origin animal every five years over the next 100 years (Figure 18). Running this simulation resulted in achieving the population goals. The population with the suggested intervention can retain 90.5% of the genetic diversity sampled for establishing it for the next 100 years.

Population Variables	Values

4.4 Pairing Recommendations

Pairing recommendations were made based on Mate suitability index calculated using PMx. Mate Suitability Index (MSI) was used as the criteria for deciding pairing as it takes into consideration multiple genetic parameters that influence the genetic viability of population. While, taking individual parameters into consideration one at a time is a cumbersome and time consuming process and can lead to erroneous recommendations.

Mate Suitability Index (MSI)	SI	Sire	Dam	MSI
<p>Mate Suitability Index (MSI) It is a numerical genetic assessment of a male-female pair that incorporates several variables into one ranking (MSI range is 1 to 7, with 1 being the most genetically beneficial). The default value in the table is the <i>MSI</i> (Mate Suitability Index) value for each male – female pair. <i>MSI</i> is a composite score that integrates four genetic components into a single index:</p> <p>Delta GD (dGD): Change in gene diversity (GD) of the population if one offspring is produced by the pair. Positive dGD increases the GD of the population, while negative dGD decreases GD.</p> <p>Differences in MK values (MKDiff): Difference in the genetic value (mean kinship value) of the male and female. Breeding a pair with a large MKDiff is detrimental because it combines under-represented and over-represented genetic lines.</p> <p>Inbreeding coefficient (F): Inbreeding coefficient of any offspring resulting from the pair (i.e., the kinship value for the pair). Inbreeding is considered to be detrimental to the fitness of the resulting offspring.</p> <p>Unknown ancestry: The amount of unknown ancestry in the male and female. Incomplete pedigree information means that the genetic value and relatedness of a pair cannot be accurately calculated.</p> <p>These variables are combined using a default set of definitions (that can be modified on the genetic Settings tab) to assign a <i>MSI</i> score of 1 to 6 for each pair, which can be thought of as follows:</p> <ul style="list-style-type: none"> 1 = very beneficial (genetically) to the population 2 = moderately beneficial 3 = slightly beneficial 4 = slightly detrimental 5 = detrimental, should only be used if demographically necessary 6 = very detrimental (should be considered only if demographic considerations override preservation of genetic diversity) “-“ = very highly detrimental (should not be paired, due to high level of kinship of pair) <p>Using Pairwise Info The default table of <i>MSI</i> values for pairs can be used to quickly assess the relative genetic value of a pair, subset of pairs, potential mates for one individual, and many other valuable data when making breeding recommendations. This can be especially helpful to quickly explore options for pairing individuals at one facility that houses numerous individuals of each sex or to quickly identify an alternative suitable mate if a recommended breeding fails.</p> <p>Source: Taylor-Holzer, K. 5. CONCLUSIONS AND RECOMMENDATIONS

The current population in captivity comprises of 162 (77.84.1) individuals in 22 institutions. The mean population growth rate (λ) of the population is 1.019 and the mean generation time is 7.7 years. The population includes 77 (41.36) individuals in the prime reproductive age classes and a further 15 (5.10) in the pre-reproductive age classes.

It retains a large part of the genetic diversity (0.9632) introduced by way of founders. It has relatively low values of mean inbreeding (0.0266) and population mean kinship (0.0368). It also includes 39 living founders and 20 potential founders. Simulations to assess the demographic stability and genetic viability of the population over 100 years indicates the need for supplementation with 1 wild origin animal every five years and increasing the population size to 250 individuals.

The salient findings of the studbook are listed below:

- The population is currently growing at a slow rate and can be considered to be demographically stable and capable of further rapid growth.
- The current population in the active breeding pool allows appropriate mating choices for managing the genetic diversity of the population.
- Low values of population mean kinship and inbreeding coefficient indicate the retention of a large proportion of the genetic diversity and low level of relatedness between individuals of the population.
- The presence of a large number of founders and potential founders indicates the possibility of a further increase in the genetic diversity retained in the population.

The result of the analysis carried out suggests that husbandry practices in use are appropriate for managing the species in captivity as the population continues to show an increasing trend. Further the above factors ensure the long term survival of the population in captivity. However supplementation with wild origin animals and increasing the population size as suggested above will ensure the long term survival of the species in captivity.
